

BDL REMPART – C SHARE

Investment approach and Objectives

BDL Rempart is an Equity Long Short fund invested in equities listed on the regulated markets of the European Union and the OCDE Countries. The fund performance relies on a stock picking process, on the long and short sides of the book, driven by fundamentals and a proprietary research. Exposures result from investment ideas.

The use of these instruments can lead to a leverage effect. This mechanism amplifies the investment capacity. This leverage effect leads to an increased risk of capital loss or potential return.

Risk and Return profile

RISK LEVEL - SRI

The SRI assumes that you hold the Product for the full recommended holding period of at least 3 years

The investor's attention is drawn to the risk factors of the fund, in particular equity risk, credit risk, liquidity risk, counterparty risk, and risks related to derivatives and counterparties

	1 year	3 years	5 years
Performance of the fund	2.2%	30.0%	37.8%
Fund volatility	8.2%	9.3%	16.0%
Sharpe ratio	0.27	0.99	0.41

Monthly Comment

Over the month of February, the BDL Rempart fund posted a performance of -0.5% versus 0.3% for the €STR. The buy and sell pockets consumed -1.2% and -0.5% alpha, respectively. Net positive exposure to the European market (SXXR) yielded 1.2% performance.

Saint Gobain (0.7%) is the main positive contributor. The publication of 2023 results validates our investment thesis, with a group that can now structurally deliver margins more than 10%, despite a new construction market in Europe and the USA at low points. There are several reasons for this: the resilience of renovation in these markets, structural growth in construction chemicals, an exit since 2019 from markets where Saint-Gobain was not the leader, and a strengthening outside Europe that make it a leader in the sustainable construction market, with cash generation of €3.3 billion in 2023, an all-time high. Daimler truck (0.5%) published results for 2023 that demonstrate the Group's transformation since its IPO, with a now double-digit industrial margin (10.1%) and cash generation close to €3 billion. The guidance for 2024 also reassured the market, with expected stable or rising sales, an estimated industrial margin of between 9.0% and 10.5%, and slightly higher cash flow, confirming the resilience of the company's business model. Smurfit Kappa (+0.4%) reported reassuring results, with slightly higher volumes heralding the end of destocking. In addition, several announcements of price rises for cardboard raw materials supported the share, with a beneficial effect for Smurfit, which is vertically integrated. Siemens' results (+0.4%) were slightly better than expected, with good cash generation. In line with Vinci's results, Eiffage's results (+0.3%) were in line on the income statement and well ahead on cash generation at €2.3 billion, with an order book up 40%, providing visibility for future years on the infrastructure side.

Conversely, the main detractor (-0.6%) was the thematic basket of stocks we consider overpriced. Equinor (-0.4%) fell on the publication of its annual results, on the announcement of high returns to shareholders in absolute terms (~25% of market capitalization over 2 years) but below market expectations, combined with a \$1 billion increase in investments in renewable energy. We remain shareholders because profitability remains very strong at these oil and gas price levels, capital allocation remains very shareholder-friendly, and the company should be able to reassure on its investments in renewables with the entry of new partners in wind projects.

GLOSSARY

Alpha : The alpha measures the performance of a portfolio compared to its benchmark. A negative alpha means that the fund has done less well than its indicator (e.g. the indicator has risen by 10% in one year and the fund has only risen by 6%: its alpha is equal to - 4). A positive alpha characterizes a fund that has done better than its indicator (e.g. the indicator has risen by 6% in one year and the fund has risen by 10%: its alpha is equal to 4).

Bottom-up approach : Bottom-up investment : Investment based on the analysis of companies, where the history, management and potential of the companies in question are considered more important than the general trends of the market or the sector (as opposed to top-down investment).

Beta: Beta measures the existing relationship between fluctuations in the fund's net asset values and fluctuations in the levels of its benchmark. A beta of less than 1 indicates that the fund is "cushioning" the fluctuations of its index (beta = 0.6 means that the fund increases by 6% if the index increases by 10% and decreases by 6% if the index decreases by 10%). A beta greater than 1 indicates that the fund "amplifies" the fluctuations of its index (beta = 1.4 means that the fund rises by 14% when the index rises by 10% but also falls by 14% when the index falls by 10%). A beta lower than 0 indicates that the fund reacts inversely to the fluctuations of its index (beta = -0.6 means that the fund falls by 6% when the index rises by 10% and vice versa).

Sharpe ratio: The Sharpe ratio measures the excess return over the risk-free rate divided by the standard deviation of that return. It is a measure of the marginal return per unit of risk. When it is positive, the higher it is, the more risk is rewarded. A negative Sharpe ratio does not necessarily mean that the portfolio has had a negative performance but that it has been lower than a risk-free investment.

SICAV: Société d'Investissement à Capital Variable (open-ended investment company)

Investment rate/exposure rate: The investment rate corresponds to the amount of assets invested expressed as a % of the portfolio. The exposure rate corresponds to the investment rate plus the impact of derivative strategies. It corresponds to the percentage of real assets exposed to a given risk. Derivative strategies may be designed to increase exposure (boosting strategy) or reduce exposure (immunizing strategy) to the underlying asset.

Net asset value: Price of a unit (in the case of a mutual fund) or a share (in the case of a SICAV).

VaR: The value at risk (VaR) represents the maximum potential loss of an investor on the value of a portfolio of financial assets given a holding horizon (20 days) and a confidence interval (99%). This potential loss is represented as a percentage of the portfolio's total assets. It is calculated from a sample of historical data (over a period of 2 years)

Alpha : Bloomberg data.

Cyclical stocks: A cyclical stock is, as its name indicates, a stock that will follow a cycle. It is linked to the economic cycle. It will take off in good times of economic recovery or growth and will decline at the slightest downturn. Cyclical stocks therefore have a cyclical evolution.

Short selling: Selling forward an asset that one does not hold on the day the sale is negotiated but that one is in a position to hold on the day it is expected to be delivered. If the value of the asset declines after the short sale, the seller can buy it back for cash and realize a capital gain. The potential gain is limited to the value of the asset. If the value of the asset rises, the seller is exposed to an unlimited risk of loss.

DISCLAIMER

The purpose of this commercial document is to give information in a simple way on the fund's characteristics. It is intended for French professional investors. This document has been prepared for information purposes only and does not constitute an offer to sell. This document is not and shall not be interpreted or perceived as an offer or solicitation to invest in the fund presented, nor as investment, legal, tax or other advice, nor shall it inspire any investment or decision whatsoever.
