

BDL TRANSITIONS – C SHARE

29/02/2024

Monthly report

Investment approach

BDL Transitions is a Long Only ESG fund that invests in five themes:

- Energy Transition
- Digital Transition
- Mobility and Infrastructure Transition
- Health Transition
- New Economy Transition

Risk and Return profile

RISK LEVEL - SRI

The SRI assumes that you keep the Product for the entire recommended holding period of 3 to 5 years minimum

The investor's attention is drawn to the risk factors of the fund, in particular equity risk, credit risk, liquidity risk, counterparty risk, and risks related to derivatives and counterparties

	1 year	3 years
Outperformance vs Index	5.0%	-9.6%
Fund volatility	12.5%	14.4%
Index volatility	11.4%	14.5%
Sharpe ratio	1.21	0.47
Sortino ratio	1.82	0.69
Calmar ratio	1.38	0.26
Tracking Error	7.3%	6.5%
Information Ratio	2.07	1.05
Fund Max. drawdown	-11.0%	-26.4%
Recovery (in working days)	48	518

Investment Universe

BDL Transitions aims to capture exposure to five major themes of fundamental change across the economy. The ESG angle is systematically integrated into the fundamental analysis. The fund invests in companies in the European Economic Area and Switzerland with a market capitalization or turnover of more than €1 billion and up to 30% of its assets in shares listed on the financial markets of OECD member states or in companies with a turnover or capitalization of less than €1 billion.

Monthly Comment

February was a good month for the fund in absolute terms, with an increase of +4.9% versus +2% for the Stock 600. This result is essentially due to the good results of the companies in the portfolio, with expectations beaten by 77% for the Q4 23 period.

The benefits of the fund's multi-thematic strategy were highlighted with our top contributors over the month from four different megatrends: Digital Transition, New Economy Transition, Healthcare Transition, Energy Transition. On the negative contributions for the month, our investments in utilities remain difficult, as we already mentioned in January. Stable interest rates, falling energy prices and political risks are weighing on the renewables theme in the short term. We remain constructive: interest rates have stopped rising, demand for renewable energies remains very strong, energy prices are now low, and regulators are beginning to relax their policies, as demonstrated by the latest offshore wind auction, revised by +35% in price by the State of New York to make the project viable. Returns on investment in renewables appear to be attractive once again, a factor which we believe is no longer reflected in stock prices.

IBERDROLA SA	Energy Transition	16.3

The impact KPIs correspond to data from the BDLCM Funds - BDL Transitions impact report, the companies annual and sustainability reports. This report is available on our website at [tinyurl.com/mry3nhbn](https://www.bdlcm.com/mry3nhbn). The data in the impact report is based on the data in our ESG QIRA analysis system based on the portfolio as of June 30, 2021, which is biased in comparison to the other data in this monthly report. QIRA data may be based on periods prior to June 30, 2021 (e.g., companies' 2020 annual reports). For more information on the methodologies used to calculate ESG indicators, and on our approach as a responsible investor, please refer to our transparency code and the documents available on our website at the following address: <https://www.bdlcm.com/notre-approche-esg/>

QIRA METHODOLOGY

QIRA stands for Quality Investing & Responsible Analysis. This summarizes our investment philosophy: to select quality companies whose practices are focused on making their business model sustainable. The basis of QIRA is a questionnaire of 50 questions inspired by the Sustainable Development Goals (SDGs). The QIRA score is the sum of the scores of the 3 pillars E, S and G.

The QIRA score is composed of two components: Transparency and Quality. Through our regular dialogue with companies, reading sustainability reports and other documents, we complete this questionnaire to give an ESG transparency score to each company we invest in. We then provide a quality rating for ESG practices based on the knowledge of our sector analysts and our partnership with the Carbon Disclosure Project (CDP) on the environment. The sum of the Transparency and Quality scores gives us a score out of twenty, which is the QIRA score.

CLIMATE TRAJECTORY METHODOLOGY

We have created a synthetic indicator to simply and concretely reflect the climate trajectory of the BDL Transitions portfolio.

The calculation method for this synthetic indicator is described below:

For each company in the portfolio, we assess its level of commitment to SBTi (Science Based Target initiative) for the scientific validation of its CO2 reduction targets.

- If the company is not committed to SBTi, we consider that its targets are not yet ambitious enough and assign the company a punitive climate trajectory.

- If the company is committed to the SBTi initiative but its objectives have not yet been validated, we assign it an improving climate trajectory.

Finally, when the company's goal has been validated by SBTi, we assign the climate trajectory validated by SBTi. For example, SIG Combibloc has SBTi validated targets on a 1.5 degree trajectory, so we assign it a climate trajectory of 1.5 degrees.

We then average all the individual trajectories obtained to get the synthetic climate trajectory indicator for the portfolio.

GLOSSARY

Alpha : The alpha measures the performance of a portfolio compared to its benchmark. A negative alpha means that the fund has done less well than its indicator (e.g. the indicator has risen by 10% in one year and the fund has only risen by 6%: its alpha is equal to - 4). A positive alpha characterizes a fund that has done better than its indicator (e.g. the indicator has risen by 6% in one year and the fund has risen by 10%: its alpha is equal to 4).

Bottom-up approach : Bottom-up investment : Investment based on the analysis of companies, where the history, management and potential of the companies in question are considered more important than the general trends of the market or the sector (as opposed to top-down investment).

Beta: Beta measures the existing relationship between fluctuations in the fund's net asset values and fluctuations in the levels of its benchmark. A beta of less than 1 indicates that the fund is "cushioning" the fluctuations of its index (beta = 0.6 means that the fund increases by 6% if the index increases by 10% and decreases by 6% if the index decreases by 10%). A beta greater than 1 indicates that the fund "amplifies" the fluctuations of its index (beta = 1.4 means that the fund rises by 14% when the index rises by 10% but also falls by 14% when the index falls by 10%). A beta lower than 0 indicates that the fund reacts inversely to the fluctuations of its index (beta = -0.6 means that the fund falls by 6% when the index rises by 10% and vice versa).

Sharpe ratio: The Sharpe ratio measures the excess return over the risk-free rate divided by the standard deviation of that return. It is a measure of the marginal return per unit of risk. When it is positive, the higher it is, the more risk is rewarded. A negative Sharpe ratio does not necessarily mean that the portfolio has had a negative performance but that it has been lower than a risk-free investment.

SICAV: Société d'Investissement à Capital Variable (open-ended investment company)

Investment rate/exposure rate: The investment rate corresponds to the amount of assets invested expressed as a % of the portfolio. The exposure rate corresponds to the investment rate plus the impact of derivative strategies. It corresponds to the percentage of real assets exposed to a given risk. Derivative strategies may be designed to increase exposure (boosting strategy) or reduce exposure (immunizing strategy) to the underlying asset.

Net asset value: Price of a unit (in the case of a mutual fund) or a share (in the case of a SICAV).

Cyclical stocks: A cyclical stock is, as its name indicates, a stock that will follow a cycle. It is linked to the economic cycle. It will take off in good times of economic recovery or growth and will decline at the slightest downturn. Cyclical stocks therefore have a cyclical evolution.
