

DURANDAL – SHARE GP

Investment approach and Objectives

BDLCM Fund - Durandal is a Long Short Equity Fund invested in equities from OECD countries. It is based on a quantitative approach, that is it applies to quantitative data analysis methods in order to build a diversified portfolio. The strategy is systematic, diversified (300 stocks), with low net market exposure and small sectoral and country bias.

The use of these instruments can lead to a leverage effect. This mechanism amplifies the investment capacity. This leverage effect leads to an increased risk of capital loss or potential return.

Risk and Return profile

RISK LEVEL - SRI

The SRI assumes that you hold the Product for the full recommended holding period of at least 3 years

The investor's attention is drawn to the risk factors of the fund, in particular equity risk, credit risk, liquidity risk, counterparty risk, and risks related to derivatives and counterparties.

Monthly Comment

During April, the EuroSTOXX600 index displayed a strong performance, registering a 4.04% increase. This positive trend benefited the Durandal fund, which achieved a satisfactory performance during the period.

Our fund primarily benefited from the progress of the Value factor, measured by the MSEEVAL index, which recorded a significant increase of +2.26%. This direction was in line with our expectations and positively contributed to our overall performance. During the same period, the Quality factor, represented by the MSEEQLTY index, experienced underperformance with a decline of -4.75%.

This divergence in factor performances is consistent with our proprietary economic indicator, QMI, which continues to indicate a Recovery phase. Consequently, we maintain our strategic positioning in line with the signals from our indicator.

Additionally, our technical environment indicator for short positions indicates a neutral situation, providing a favorable context for managing the risks associated with these positions in our portfolio.

Past performance is not a reliable indicator of future performance.
They are not constant over time and are not guaranteed.

GLOSSARY

Alpha : The alpha measures the performance of a portfolio compared to its benchmark. A negative alpha means that the fund has done less well than its indicator (e.g. the indicator has risen by 10% in one year and the fund has only risen by 6%: its alpha is equal to - 4). A positive alpha characterizes a fund that has done better than its indicator (e.g. the indicator has risen by 6% in one year and the fund has risen by 10%: its alpha is equal to 4).

Bottom-up approach : Bottom-up investment : Investment based on the analysis of companies, where the history, management and potential of the companies in question are considered more important than the general trends of the market or the sector (as opposed to top-down investment).

Beta: Beta measures the existing relationship between fluctuations in the fund's net asset values and fluctuations in the levels of its benchmark. A beta of less than 1 indicates that the fund is "cushioning" the fluctuations of its index (beta = 0.6 means that the fund increases by 6% if the index increases by 10% and decreases by 6% if the index decreases by 10%). A beta greater than 1 indicates that the fund "amplifies" the fluctuations of its index (beta = 1.4 means that the fund rises by 14% when the index rises by 10% but also falls by 14% when the index falls by 10%). A beta lower than 0 indicates that the fund reacts inversely to the fluctuations of its index (beta = -0.6 means that the fund falls by 6% when the index rises by 10% and vice versa).

Sharpe ratio: The Sharpe ratio measures the excess return over the risk-free rate divided by the standard deviation of that return. It is a measure of the marginal return per unit of risk. When it is positive, the higher it is, the more risk is rewarded. A negative Sharpe ratio does not necessarily mean that the portfolio has had a negative performance but that it has been lower than a risk-free investment.

SICAV: Société d'Investissement à Capital Variable (open-ended investment company)

Investment rate/exposure rate: The investment rate corresponds to the amount of assets invested expressed as a % of the portfolio. The exposure rate corresponds to the investment rate plus the impact of derivative strategies. It corresponds to the percentage of real assets exposed to a given risk. Derivative strategies may be designed to increase exposure (boosting strategy) or reduce exposure (immunizing strategy) to the underlying asset.

Net asset value: Price of a unit (in the case of a mutual fund) or a share (in the case of a SICAV).

VaR: The value at risk (VaR) represents the maximum potential loss of an investor on the value of a portfolio of financial assets given a holding horizon (20 days) and a confidence interval (99%). This potential loss is represented as a percentage of the portfolio's total assets. It is calculated from a sample of historical data (over a period of 2 years)

The Z-Score : For a given factor, it corresponds to the deviation from the average of our universe measured in standard deviation

Quality: a factor measuring a company's level of debt and the stability of its historical revenues

Growth: a factor measuring a company's revenue growth prospects

Valuation: factor measuring the attractiveness of a company in relation to its price

Momentum: a factor measuring the improvement in a company's dividend, earnings and price

Risk: a factor measuring the volatility of a company

Sentiment: a factor measuring analysts' expectations of a company

Factor Volatility: volatility related to factors (such as Valuation, Quality, Growth, etc.)

Macro regime: QMI phase (expansion, slowdown, contraction or recovery)

QMI: Quantitative Macro Index, a proprietary index of BDL Capital Management. This index is an aggregation of macroeconomic data; the variables used are, among others, the German IFO, the Monetary Growth of the Eurozone or the OECD leading indicators. The economic regime depends on the sign and direction of the index. For more information on this index, see the September 2019 Quantitative Management Newsletter

DISCLAIMER

The purpose of this commercial document is to give information in a simple way on the fund's characteristics. It is intended for French professional investors. This document has been prepared for information purposes only and does not constitute an offer to sell. This document is not and shall not be interpreted or perceived as an offer or solicitation to invest in the fund presented, nor as investment, legal, tax or other advice, nor shall it inspire any investment or decision whatsoever. The information contained in this document is not a substitute for the recipient's own judgment, which must be relied upon. In any event, the information presented is not sufficient to provide an understanding for an informed investment in this product. An investment in one of BDL Capital Management's funds should only be considered after consulting the prospectus. Past performance is not a reliable indicator of future performance. They are not constant over time and are not guaranteed. The investor's attention is drawn to the risk factors of the fund, in particular the credit risk, the liquidity risk, the counterparty risk and the impact of management techniques, particularly Forward Financial Instruments. The fund's benchmark (Capitalised €STR) is computed excluding dividends, it can be misleading when comparing performances. For more information on the risks to which the fund is exposed, we invite you to consult the fund's DICI, available on request or on BDL Capital Management's website. An information on the right of claim and the class action exercise is available in English on BDL Capital Management website: <https://www.bdlcm.com/informations-reglementaires>. BDL has the right to cease the commercialization of their funds according to the article 93 bis of the guideline 2009/65/CE and the article 32 bis of the guideline 2011/61/UE.
